Start

(parameter values)

Use value intervals to determine which counts (parameter values) are to be mapped to which bins

FIG. 8 End

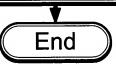

Start

Compute term frequency (parameter value) for a given bin as weighted average of frequencies (parameter values) in given bin

Separately establish bin boundaries and term frequencies (parameter values) for the individual terms (features)

Establish values of term counts (parameter values) used in scoring for all actual count values (parameter values) falling in a given bin based on how term counts (parameter values) are employed in scoring formula
